

Smoking Poly License FAQ

Operational FAQ for live-trading activation, refresh, and expected user behavior.

What does the license control?

The live-trading license only controls whether the bot is allowed to place real Polymarket orders. Paper Trading stays usable even without activation.

Does the user need to know the worker URL?

No. The packaged app is built with the official activation worker path already baked in. End users should not need to know or enter the activation URL.

How does activation work?

The bot sends the saved POLY_FUNDER to the Cloudflare license worker. The worker checks Whop, issues a signed grant when valid, and the bot verifies that signed grant locally before unlocking live trading.

When does the bot check activation?

- At startup if a funder wallet is already configured.
- After wallet credentials are saved.
- When the user presses Check Activation.
- Roughly once per day after the last successful activation refresh.

What usually causes an inactive license?

- The saved POLY_FUNDER does not match the licensed wallet used in Whop.
- The user has not bought or renewed the license yet.
- The worker cannot confirm the membership.
- The app cannot reach the activation worker because of network or DNS issues.

Can one license be tied to another wallet automatically?

No. The matching rule depends on the wallet funder address saved in the bot and the funder address provided during purchase. If they do not match, activation should stay blocked.

Does delaying activation delay expiration?

No. License duration is controlled by the seller side and membership status. Waiting to activate the bot does not extend the commercial license period.

What should support ask first?

- Which POLY_FUNDER is saved in Settings?

- Does the Whop purchase use the same funder address?
- Does the dashboard show a specific reason such as Missing grant or wallet mismatch?
- Can the app reach the internet and the worker URL?
